

Benefits Of Using Ultrasonic With PBSerum Body

What is Ultrasonic?

Ultrasonic is also known as ultrasound, cavi-lipo, radiofrequency or ultra-cavitation. Ultrasonic is a painless, non-surgical body contouring technique that is performed as an alternative to liposuction, it uses ultrasonic waves to turn fat cells into free fatty acids, which are easier for the body to get rid of. Patients generally get satisfactory results after undergoing ultrasonic to address stubborn fat deposits. The procedure requires a series of treatments, wherein a specialist targets problem areas with low frequency ultrasound waves.

Ultrasonic is a circumferential reduction procedure. This means that you won't be able to measure your success by how much fatty tissue you've lost, but instead by how many inches you've shrunk in your treatment area. In other words, it won't provide the same fat removal power as liposuction, but it might help you slim down those love handles or upper arms. Generally speaking, circumferential reduction is enough for people who just want to smooth, tighten, and tone a specific body area.

How does Ultrasonic work?

The ultrasonic fat treatment works by eliminating fat and toxins via the lymphatic and urinary systems. Typically, a single fat ultrasonic session lasts forty minutes when treating a single part of the body. The body requires three days to properly eliminate the fat and toxins after a treatment. This is to ensure your body utilizes the triglycerides (a type of body fat) released by the ultrasonic fat treatment process.

PBSerum and Ultrasonic

The use of PBSerum Body with a Slimming Ultrasonic Machine gives maximum results, improving the capacity of the active ingredients to obtain excellent results in treatment. The unique combination of processes involved when using PBSerum Body and a skin tightening Slimming Ultrasonic Machine, provides both an immediate effect, followed by further long-term skin tightening, restructuring and rejuvenating benefits. As ultrasonic and PBSerum Body (replacing regular conductive gel) is utilized during treatments, it allows the benefits of the active ingredients in PBSerum Body to achieve ultimate results. Using the ultrasonic technology helps to improve the final effects of the treatment.

To get the most out of your treatments, it is recommended to drink lots of water, maintain a healthy diet and exercise regularly in-between sessions. In fact, it's important that patients drink at least 3 pints or 1.5 L of water before and after treatments in order to help the body expel the fatty acids.
